From Reactive to Proactive IoT Management

Most IoT teams discover problems too late. Faults surface after devices go offline, overages show up on the monthly bill, and changes that should take seconds require a call to your account manager.

The Cellhire SIM Management Portal puts you back in control. Monitor usage in near real-time, activate SIMs on demand, resolve faults remotely and keep costs in check. All from a single platform.

Key benefits:

- ✓ Gain near-real-time visibility into data usage.
- ✓ Activate SIMs instantly when you're ready to go live.
- ✓ Protect against misuse with IMEI locking.
- ✓ Control spend by using alerts and automated barring.
- ✓ Diagnose and resolve connectivity issues in seconds.
- ✓ Manage large SIM estates quickly and easily.

Near Real-Time Visibility

Replace assumptions with data

Prevent sending engineers to the site unnecessarily. With near real-time usage data and full session history, you can see instantly whether a device is offline due to a SIM issue and resolve it remotely. Spot abnormal data consumption before it becomes a problem, and make faster, better-informed decisions across your entire fleet.

Session History

Select the date range you wish to export. A maximum date range of 7 days is supported.

SIM Provisioning

On-demand activation

Only pay for connectivity when your devices actually go live. Provision SIMs to the right tariff at the exact moment of deployment. No pre-activation waste, no calls to your account manager. From a 10-device pilot to a nationwide IoT rollout, you stay in full control of when and how your fleet comes online.

IMEI Locks

Zero unauthorised usage

IoT devices in remote or unattended locations are a target for SIM theft. IMEI locking binds each SIM to its designated device, so if a SIM is removed and placed in another device, it's immediately blocked. No unexpected bills, no fraudulent usage, and no exposure from compromised hardware.

Alert Manager

Automatic overage control

A faulty sensor or software loop can exhaust a data allowance in hours. Alert Manager keeps you ahead of it by notifying the right people by email or SMS when a SIM hits a usage threshold and automatically barring it at a set limit. You get full control over spend without having to watch every device manually.

Refresh Functionality

Remote diagnosis and resolution

When a connected device goes offline, the cause is not always obvious. Refresh clears the device from the network and reconnects it, quickly establishing whether the issue lies with the network or the device itself. Resolve connectivity faults in seconds without an engineer visit, and keep your fleet running without unnecessary site callouts.

Dashboard Overview

Full estate at a glance

Managing a large IoT estate without visibility is a risk. The dashboard gives you a live view of your entire fleet: which SIMs are active, which are approaching limits, and where anomalies are appearing. Catch overages and device faults early, before they translate into unexpected costs or service failures.

SIM Orders

Integrated ordering

Order new SIM cards directly through the portal, without leaving your management environment. No procurement tickets, no account manager calls, no separate tools. Whether scaling a deployment or replacing a faulty device, new SIMs stay aligned with your live estate from day one.
